1. INTRODUCTION

1.1 Terms of Reference

The purpose of this semi-annual monitoring report is to present the results obtained between July 1, 2003 and December 31, 2003, of the Landfill Bioreactor Project at the Maplewood Recycling and Waste Disposal Facility (Maplewood Landfill) in Amelia County, Virginia. The bioreactor study is being performed by Waste Management of Virginia, Inc. (a Waste Management, Inc. (WMI) company) under the United States Environmental Protection Agency's (USEPA's) Project XL program. This monitoring report was prepared for the Virginia Department of Environmental Quality (VADEQ) by Mr. Douglas T. Mandeville, and reviewed by Mr. Thomas B. Ramsey, P.E., and Mr. Michael F. Houlihan, P.E., all of GeoSyntec Consultants (GeoSyntec), in accordance with the internal peer review policy of the firm. This report describes the monitoring activities between the above mentioned dates. To aid in the interpretation of the data, the tables and figures contain all of the data collected since leachate recirculation began on August 20, 2002.

1.2 Project Overview

The Maplewood Landfill is located in Amelia County, Virginia, approximately 30 miles southwest of Richmond, Virginia. The waste disposal area will cover approximately 404 acres upon completion. Construction of the first phases started in 1992; construction of the most recent phase was completed in 2003. The Maplewood Landfill was constructed having a geomembrane composite double-liner system, with primary leachate collection and leak detection (secondary collection) layers. The current configuration of Phases 1 through 4 is shown in Figure 1 and Drawing 1. As part of the XL program, Phases 1 and 2 are operated as bioreactors (i.e., leachate is recirculated); whereas Phases 3 and 4 are operated as standard landfill cells (i.e., no leachate is recirculated). Phases 1 and 2 of the Maplewood Landfill are referred to as the test area. Phases 3 and 4 are referred to as the control area.

A landfill becomes a bioreactor when leachate and other liquids are added to the landfill. The purposes of operating a landfill as a bioreactor are to increase the rate of biodegradation in the landfill and to facilitate the management of leachate and other waste liquids. The original intent of the program was to recirculate all of the leachate

generated at the site, typically between 3 to 4 million gallons per year. WMI will seek to recirculate this amount, and maintain compliance with applicable rules and regulations. In the interest of maintaining compliance with good landfill operating practices and environmental protection, the actual amount of leachate recirculated may be less than 4 million gallons per year. The amount of liquid applied to the waste will vary based on site inspections and observations. Regardless of the quantity of leachate recirculated, the requirement to perform monitoring during the course of the program will continue.

It is anticipated that operating Phases 1 and 2 as a bioreactor will result in several environmental and cost saving benefits including, but not limited to, the following: (i) decreased leachate management costs; (ii) increased waste density in the landfill; (iii) reduced period of landfill gas generation; and (iv) improved long-term leachate quality. These benefits are discussed in depth in WMI's Project XL application [GeoSyntec, 2000].

The performance of the landfill is evaluated based on measurements of critical chemical and physical parameters associated with the solids, liquids, and gasses obtained from the test and control areas. Parameters to be measured include: settlement, leachate quantity and quality, in-place density of waste, and air quality. The parameters measured in the bioreactor area (i.e., test area) are compared to similar parameters measured from the control area.

1.3 Report Organization

In this report, the results of the analytical tests conducted during the first half of calendar year 2003 will be provided. The organization of this report is described below.

- Section 2 addresses the Federal register site specific rule making.
- Section 3 presents the requirements of VADEQ Experimental Permit.
- Section 4 describes the monitoring program and sampling and analysis activities performed during the first half of calendar year 2003.
- Section 5 describes the analytical test results and other data collected during the first half of calendar year 2003.

- Section 6 presents closing comments.
- Section 7 provides references.
- Appendix A presents leachate laboratory analysis results.
- Appendix B presents the liquid application logs (a daily and monthly liquid application summary is presented in Table 7).
- Appendix C presents the trench monitoring logs.
- Appendix D presents landfill settlement data.
- Appendix E presents landfill gas data.
- Appendix F presents groundwater quality compliance data.

2. REQUIREMENTS OF FEDERAL REGISTER SITE-SPECIFIC RULE MAKING

On July 18, 2002, the EPA promulgated a site-specific rule to implement this project under the EPA's Project Excellence and Leadership Program (Project XL). This rule was published in the Federal Register and provides site-specific regulatory flexibility under the Resource Conservation and Recovery Act (RCRA) for the Maplewood Landfill. Part 258, Subpart D of the rule identifies 14 conditions that are to be met while leachate is recirculated at Maplewood. The remainder of this section addresses 12 of these conditions; the last two conditions are related to the duration of, and compliance with, the site specific rule.

1) *Item 1 relates to the integrity of the liner system and maintaining less than 30 cm of head on the liner system.* In accordance with Item 1, the integrity of the liner system was maintained during construction of the recirculation trenches and the leachate collection system has been maintained in good operating order. To date, the leachate collection records for the test and control areas indicate that the leachate collection system is functioning as intended. Additionally, there has not been an increase in the leachate collection rate in the secondary leachate collection system. It is noted that design calculations showed that up to 3 to 4 million gallons of liquid per year could be added to the waste mass and that the head on the liner system would remain less than 30 cm. The liquid application rate is approximately 1.8 million gallons per year based on data between August 20, 2002 and December 31, 2003. Based on the design calculations and the actual leachate recirculation rates, the head on the liner system is expected to be less than 30 cm. Additionally, the leachate collection system has been designed to operate such that the leachate removal pumps turn on when the head acting on the liner system at or below 30 cm.

   There are no apparent signs of slope movement based on daily observations at the site.

2) *Item 2 relates to the Code of Federal Regulations (CFR) Section 258.40.* In accordance with Item 2, the groundwater quality has been monitored and analyzed at the compliance point. This analysis was performed by Joyce Engineering, Inc. (Joyce Engineering); a copy of the letter is presented in

Appendix F. Lead has been detected at concentrations that exceed the current MCL; however, it is noted that the detected concentrations were less than the facility background concentrations at the time of detection. Joyce Engineering determined that the concentrations did not represent statistically significant concentrations. As per VADEQ, the monitoring program at the Maplewood Landfill, Permit No. 540, was allowed to continue in the Detection Monitoring Program.

3) *Item 3 relates to the occurrence of seeps at the landfill.* No surface seeps have occurred at the Maplewood Landfill between July 1, 2003 and December 31, 2003 that were associated with the leachate recirculation operations.

4) *Item 4 relates to the leachate quality parameters to be analyzed as part of this project.* The evaluation of the key leachate quality parameters occurred at the frequency presented in the Final Project Agreement [GeoSyntec, 2000] and the VADEQ state permit [GeoSyntec, 2001]. The test results are discussed in Section 5.1. It should be noted that these parameters (or groups of parameters) have been analyzed in leachate samples collected from the test and control areas. Appendix A includes a summary of the leachate parameters that exceeded the MCL or were detected. A complete set of laboratory results is available upon request.

5) *Item 5 relates to the quantity of leachate applied to the test area and the amount of leachate collected in the test and control areas of the landfill.* These issues are discussed in Section 5.1.

6) *Item 6 relates to an initial characterization of the liquid that was added to the test area.* An initial characterization of the leachate added to the landfill was performed in August 2002. The results of this characterization indicate that the leachate is comparable to typical landfill leachate. Between July 1, 2003 and December 31, 2003, leachate was the only liquid added to the test area at Maplewood.

7) *Item 7 relates to the occurrence of landfill fires in the test area and the measurement of gas temperature at the wellheads.* The test area at Maplewood has been operated in a manner to prevent landfill fires from

occurring and none have been observed during the project. The gas temperature at the wellheads is discussed in Section 5.2.

8) *Item 8 relates to topographic surveys at the site.* In accordance with Item 8, two topographic surveys were performed in 2003. The first survey was conducted in March 2003; the second survey was conducted in June 2003. Construction and waste placement activities during late summer and fall 2003 prevented the collection of accurate survey information, therefore, no surveys were conducted. The difference in ground surface elevation between the June survey and the original survey in August 2002 was used to calculate settlement. Settlement of the test and control areas is discussed in Section 5.3.

9) *Item 9 relates to odor complaints resulting from liquid application events.* No odor complaints associated with the liquid application events were recorded at Maplewood during the reporting period.

10) *Item 10 relates to an initial waste characterization in the test area of the landfill.* A total of 5 borings were drilled in the summer of 2001. Three of these borings were in the control area and two were in the test area. The results of this testing indicates that the waste is typical MSW. Section 5.3 addresses future waste sampling activities.

11) *Item 11 relates to the preparation of semi-annual reports to the EPA Regional Administrator.* Previous semi-annual monitoring reports were submitted on May 8, 2003 and July 17, 2003. The next semi-annual monitoring report will be submitted in July 2004.

12) *Item 12 relates to additional landfill gas monitoring.* The monitoring requirements for the New Source Performance Standards (NSPS) and the Title V Air Permit for the site were met. Copies of the wellhead monitoring results and the surface scans are presented in Appendix E.

3. REQUIREMENTS OF VADEQ EXPERIMENTAL PERMIT

On July 18, 2002, VADEQ issued a permit modification allowing bioreactor operations in Phases 1 and 2 at the Maplewood Landfill. Permit module I.F. of the permit amendment issued July 18, 2002 identifies several site specific conditions that must be met while leachate is recirculated at Maplewood. The remainder of this section addresses each of these conditions.

1) *Item I.F.1 relates to the issuance of a Certificate to Operate.* Construction of the liquid application trenches was completed within 180 days of the issuance of the permit amendment. A renewal letter to continue recirculation operations was submitted to VADEQ in July 2003.

2) *Item I.F.2 relates to the expiration of the experimental permit and request for a full permit amendment.* This report presents the data obtained during the second half of calendar year 2003. At this time, there is not enough data available to draw conclusions from the experiment. If the project is found to be a success, WMI anticipates submitting a request for a full permit amendment.

3) *Item I.F.3 relates to the permitted landfill bioreactor area, Phases 1 and 2.* In accordance with the permit requirements, the liquid application trenches were constructed in Phases 1 and 2, and liquid was applied only in this part of the landfill.

4) *Item I.F.4 relates to the monitoring, sampling, and reporting requirements.* In accordance with Item I.F.4, the monitoring was completed as identified in Permit Attachment IIB-2. Previous quarterly monitoring reports were submitted in May 2003, June 2003, and September 2003. From this point on, monitoring reports will be completed on a semi-annual basis.

5) *Item I.F.5 relates to the Title V Air Permit Issued January 10, 2002 and the New Source Performance Standards Subpart WWW.* In accordance with Item I.F.5, WMI complied with the regulations identified in the Title V Air Permit and the NSPS Subpart WWW.

6) *Item I.F.6 relates to managing leachate as a hazardous waste if the characterization of leachate indicates it is hazardous in accordance with Virginia Hazardous Waste Management Regulations (9 VAC 20-60-10).* (It should be noted that leachate is not explicitly listed as a hazardous waste in the Virginia Hazardous Waste Management Regulations). The initial leachate characterization indicates that the leachate at Maplewood is not a Hazardous Waste.

7) *Item I.F.7 relates to the monitoring of leachate head over the liner at its lowest disposal point to ensure that no more than 1 foot of head of leachate accumulated over the liner.* The issue of hydraulic head acting on the liner system is addressed in Section 2, Item 1.

8) *Item I.F.8 relates to the closure of the bioreactor landfill area.* At this time, WMI plans to continue bioreactor operations in Phases 1 and 2 at Maplewood. In accordance with Item I.F.8, WMI will notify VADEQ at least 180 days prior to the anticipated date of closing.

4. MONITORING PROGRAM AND SAMPLING AND ANALYSIS ACTIVITIES

4.1 Monitoring Program

As shown in Table 1, the monitoring activities at the Maplewood Landfill consist of tracking the quality and quantity of leachate, landfill gas, and solid waste in the test and control areas. Detailed monitoring activities for the Landfill Bioreactor Program are described in the document entitled, *"Monitoring, Sampling, and Analysis Plan"* (Monitoring Plan) [GeoSyntec, 2001], which is contained in the permit application submitted to VADEQ. As part of the USEPA XL program and VADEQ permit requirements, a series of site-specific rules and monitoring requirements have been developed. The USEPA site-specific rule appeared in the Federal Register on July 18, 2002; these requirements are addressed in Section 2 of this report. The VADEQ site-specific permit requirements appeared in the state permit modification issued for the site on July 18, 2002; these requirements are addressed in Section 3 of this report. Table 1 shows the schedule followed for the 2003 monitoring events; Table 2 summarizes the dates and sampling events that have occurred to date. The leachate monitoring events include collecting leachate samples from the control area and the test area for subsequent laboratory analysis. The landfill gas monitoring events include measuring landfill gas composition at the wellheads in the control and test areas, obtaining landfill gas composition samples, and performing a surface scan to measure surface emissions. The solid waste monitoring event includes obtaining waste samples for subsequent analysis. In addition to these field monitoring events, leachate generation volumes, liquid application volumes, and landfill settlement are monitored.

The purpose of the monitoring program is to evaluate the performance of the landfill bioreactor throughout the duration of the project. The evaluation is based on the following performance criteria:

- leachate quality and quantity;
- landfill gas quality and quantity; and
- solid waste decomposition/stabilization.

The manner in which these criteria are being evaluated is described in the following three subsections.

Leachate Quality and Quantity

Sampling activities are conducted in both the test area and control area. Leachate sampling was conducted in Phases 1, 2, 3, 4, and at the leachate storage tank, according to the frequency described in Table 1. Leachate samples are collected by filling the appropriate sample bottles directly from the sampling ports from the primary leachate collection system for the respective phase being sampled. The sampling ports for each of the primary leachate collection systems are located within the vault/riser house of the leachate collection system for each phase. The specific parameters measured, and the associated test methods, are provided in Table 3. Several key parameters that identify the presence of biological processes in the landfill have been identified (Pohland and Harper, 1986) and are presented in detail in this report. These parameters include: (i) Biological Oxygen Demand (BOD); (ii) Chemical Oxygen Demand (COD); (iii) Total Organic Carbon (TOC); (iv) Chloride; (v) Sulfate; (vi) Nitrate as Nitrogen; and (vii) Ammonia as Nitrogen. From these indicators, a qualitative inference can be made regarding the degree of organic composition of landfill wastes.

In addition to evaluating the leachate quality in the landfill over time, the amount of liquid added to the leachate recirculation trenches and the amount of leachate collected in the leachate collection sumps was recorded.

Landfill Gas Quality and Quantity

Measurements of landfill gas quality are obtained from composite gas samples of the landfill gas collection system. The parameters measured and the test methods for the landfill gas monitoring and sampling are described in the Monitoring Plan [GeoSyntec, 2001]. The non methane organic compounds (NMOCs), gas samples were obtained in accordance with the requirements of USEPA Method 25 and samples obtained for volatile organic compounds were obtained in accordance with USEPA Method TO-14.

Landfill gas monitoring is performed at each of the existing landfill gas wells to monitor activity within the test and control areas. Measurements of methane (CH_4), oxygen (O_2), carbon dioxide (CO_2), temperature, and flow rate were obtained from each gas well using portable field instruments, (i.e., a Landtech, Inc., GEM 500). Hydrogen sulfide (H_2S) measurements were obtained using a GasTech GT-2 Hydrogen sulfide detector.

Surface emissions monitoring is performed in accordance with the requirements specified by the NSPS and Emissions Guidelines (EG) for MSW landfills [40 CFR 60.755]. Methane concentrations were measured within 5 to 10 centimeters (2 to 4 inches) from the landfill surface in the test and control areas.

Solid Waste Decomposition/Stabilization

To evaluate the degree of decomposition of the solid waste, a series of borings were drilled in the test and control areas in 2001. Samples of the solid waste were obtained from these borings. The parameters evaluated from these solid waste samples include: (i) moisture content; (ii) cellulose; (iii) lignin; (iv) pH; and (v) biochemical methane potential. The moisture content is the percentage of water that is present in the waste. Cellulose is the portion of the volatile solids that will degrade over time; lignin is the portion of the volatile solids that will not degrade. Biochemical methane potential is a measure of how much methane the waste may generate.

To evaluate waste settlement in both the test area and the control area, a series of topographic surveys of the test and control areas are conducted.

4.2 Sampling and Analytical Activities

The overall monitoring and sampling program was implemented by GeoSyntec with sampling performed by Joyce Engineering, Golder Associates (Golder) and WMI site personnel.

4.2.1 Leachate Quality

Leachate samples from the test and control areas were obtained by Joyce Engineering on the dates presented in Table 2. The leachate samples were collected from sumps in Phases 1, 2, 3, 4, and the leachate storage tank. The leachate samples were collected using the field sampling procedures described in the Monitoring Plan contained in the permit application for leachate recirculation at the site [GeoSyntec, 2001].

Leachate samples were analyzed by Geochemical Testing, Inc., and were tested for the parameters listed in Table 3. A summary of the key parameters identified in Section 1.3 are presented in Table 5. Also included in Table 5 are the parameters listed in the Federal Register site-specific rule (i.e., wet chemistry parameters, heavy metals, and common ions). The test results for the organic priority pollutants are not anticipated to indicate the overall performance of the test area and are not presented in Table 5 at this time. Section 5.1 of this report provides an analysis of the leachate quality data.

4.2.2 Landfill Gas Quality and Quantity

The landfill gas samples were collected using the procedures described in the Monitoring Plan contained in the permit application for leachate recirculation at the site [GeoSyntec, 2001]. Drawing 2 shows the landfill gas monitoring plan. These activities were conducted by Golder or WMI on the dates presented in Table 2. The landfill gas composition at the wellheads in the test and control areas were tested for the percentages of oxygen, carbon dioxide, methane, flow rate, and temperature. The landfill gas composition at the well heads measured during the field sampling events is summarized in Table 4.

The landfill gas samples from the header pipes in the landfill gas collection system were sent to Triangle Environmental Services for laboratory analysis. These landfill gas samples were tested in accordance with USEPA Method TO-14. Copies of these results are presented in Appendix E.

4.2.3 Waste Sampling

Prior to construction of the leachate recirculation system, a series of exploratory borings were drilled in both the test and control areas. Samples of solid waste were collected from a variety of depths at each boring location. The solid waste samples collected during the field activities were sent to Virginia Tech and were analyzed for moisture content, lignin, cellulose, pH, and biochemical methane potential. No solid waste samples were obtained during this reporting period; samples were obtained in early January 2004. The results from the initial background samples are discussed in Section 5.3; the results from the January 2004 sampling event will be discussed in the next monitoring report.

4.3 Other Data

4.3.1 Leachate Generation Quantities

Leachate flow was measured weekly in Phases 1, 2, 3, 4, 11, and 12 by site personnel using flowmeters that are installed in the leachate riser vaults near each cell. The leachate generation quantities for each phase are presented in Table 6.

4.3.2 Quantity of Liquid Applied to Landfill

The amount of liquid added to each trench was recorded by site personnel. A summary of the liquid added to the landfill is presented in Table 7.

4.3.3 Landfill Settlement

A series of topographic surveys of the test and control areas have been performed by Flora Surveying. An approximately 100-ft grid system was established, with the elevation measured at the same locations over time. A summary table containing the point number, northing, easting, and elevations at different survey times is presented in Table 8. Drawing 3 shows the settlement monitoring plan and Drawing 4 shows the settlement contours.

5. DATA ANALYSIS

5.1 Leachate Quality and Quantity

Several new site features have been added to Maplewood since the last semi-annual monitoring report was submitted. These new features affect the amount of leachate that can be recirculated and the amount of leachate that is generated. On July 3, 2003, a leachate pumping system began operating. This system pumps leachate from the storage tanks to the recirculation trenches in Phases 1 and 2 (i.e., leachate is no longer moved to the top of the landfill using haul trucks). Two additional recirculation trenches have been constructed. These trenches are approximately 20-ft deep and 5-ft wide (the previous three trenches were approximately 10-ft deep and 5-ft wide). Finally, construction of the next waste disposal phase (Phase 13) was completed in the fall of 2003; waste disposal in this cell began on November 16, 2003.

Liquid application at the Maplewood Landfill commenced on August 20, 2002. To date, leachate was the only liquid added to the test area. Figure 2 shows the liquid added to the landfill, the target rate of 4 million gallons per year (333,333 gallons per month or 6,500 gallons per day), as well as the amount of leachate collected in the test and control areas. The total amount of leachate applied to the landfill during 2002 was 864,282 gallons. Approximately 396,045 gallons of leachate were recirculated between January 1, 2003 and June 30, 2003. Between July 1, 2003 and December 31, 2003, approximately 1,205,872 gallons of leachate have been recirculated. Therefore, approximately 1,601,917 gallons of leachate have been recirculated during the 2003 calendar year. To date, a total of 2,466,199 gallons of leachate have been recirculated at Maplewood.

In reviewing Table 7, it is apparent that the majority of the leachate recirculated since July has been in the two newest trenches (i.e., Trenches 4 and 5). Use of these trenches over the last several months has indicated that they have a much higher leachate recirculation capacity than Trenches 1, 2, and 3. Trenches 4 and 5 have also been able to drain faster than Trenches 1, 2, and 3.

It should be noted that several site conditions (i.e., weather and construction) made recirculation operations difficult. Table 9 shows the average monthly precipitation, 2003 monthly precipitation, and departure from normal. In 2003, the site received approximately 20.11 inches above its normal annual precipitation.

The amount of leachate collected in the test and control areas during the operation of the liquid application system in the second half of calendar year 2003 was 131,437 and 554,466 gallons, respectively. Since August 2002, the total amount of leachate collected in the test and control areas was 459,441 and 2,275,082 gallons, respectively. It should be noted that the average monthly leachate collection rates for the test and control areas was 15,720 gallons and 102,000 gallons, respectively. No leachate was sent off-site for disposal in the second half of calendar year 2003. Figure 2 also indicates that more leachate is being collected in the control area than in the test area. It should be noted that the outward facing side slopes in the test area have been capped with the final cover system, limiting the amount of infiltration and subsequent leachate generation.

In examining Figure 2, there does not appear to be a correlation between the liquid applied to the landfill and the leachate collected in the leachate collection system. This indicates that at this time, the waste in the test area had not yet reached its absorptive capacity.

Figures 3 through 6 show variation with time in the BOD to COD ratio, COD to TOC ratio, Chloride, and Nitrate Nitrogen, respectively. These figures represent the variation in the key leachate parameters identified in Table 5. The leachate samples in both the test and control areas continue to indicate a biological oxygen demand (BOD) value in the lower ranges of typical landfill leachate (typical values range from 20 mg/l to 35,000 mg/l, [Kjeldsen et al., 2002]). Figure 7 shows the variation in Ammonia Nitrate concentration with time; in this figure, the concentration in the test area continues to be consistently lower than the concentration in the control area. Because of the limited amount of data collected so far, trends in the data cannot be identified.

Additional data related to the leachate quality results is presented in Appendix A. The tables in Appendix A summarize the leachate parameters that exceeded the MCL or were at detectable levels.

5.2 Landfill Gas Quality and Quantity

Table 4 summarizes the landfill gas composition and temperature measured at the wellheads. The wellheads are identified as being located in the test or control areas.

The temperatures measured at the wellheads are within normal ranges; this indicates that there are no landfill fires within the test or control areas.

The trends in the landfill gas quantity for the gas wells in the test and control areas are shown in Figure 8. None of the gas wells shown in Figure 8 show consistent behavior; the flow rate measured at each of the wells appears to fluctuate in a similar pattern.

Figure 9 shows the percentage methane in the landfill gas at the wells in the test and control areas. At this time, there does not appear to be a clear difference between the percentage methane present in the landfill gas in the test or control areas.

Figure 10 shows the percentage carbon dioxide in the landfill gas at the wells in the test and control areas. In 2003, the percentage carbon dioxide present in the gas measured at the wells appears to be fairly consistent between 35 and 40 percent. At this time, there does not appear to be a clear difference between the percentage carbon dioxide present in the landfill gas in the test and control areas.

During the quarterly NSPS surface emission scans, methane exceedences were detected in the vicinity of the temperature monitoring probes that were installed in 2001. Methane hits were detected at the same locations during subsequent monitoring events. These temperature probes were decommissioned in December 2003.

5.3 Solid Waste Analysis

Table 10 summarizes the baseline solid waste sampling results from the field work conducted in the summer of 2001. These results appear at this time to indicate few differences between the organic constituents in the landfill as waste. Future comparisons will be made as subsequent solid waste samples are obtained from the test and control areas. A second set of solid waste samples were obtained in early 2004; the laboratory results of these samples will be discussed in the next semi-annual monitoring report.

Drawing 4 presents the settlement contours for both the test and control areas. These contours are based on the data presented in Table 8 and show the difference in grade between the initial background survey on August 2, 2002 and a recent survey on

June 9, 2003. The values range from no settlement to up to five feet of settlement. In examining Drawing 4, two items become apparent. The settlement appears to be relatively uniform over most of the test and control areas, with the exception of the northwest corner of Phase 1 and near the Phase 4 boundary with Phase 11. In addition, it appears that settlement in the control area is larger than in the test area. Considering the relatively short timeframe over which these contours are based, this may not be indicative of the performance of the bioreactor system but the result of waste compression in the relatively newer portions of the landfill (i.e., the control area). Construction and waste placement activities in late summer and fall of 2003 did not allow for ground surveys to be performed. It is anticipated that the surveys will resume in January 2004.

6. CONCLUSIONS

This report provides a summary of the monitoring activities at the Maplewood Landfill as part of the leachate recirculation operations conducted under the USEPA's XL Program. Because the program has been operating for approximately one and a half years, definitive conclusions regarding the performance of the test area at the Maplewood Landfill cannot yet be made. However, based on the experience gained during the design, permitting, and construction processes, the following comments are offered.

- Leachate recirculation operations with a pump system have been successfully implemented and are an operational improvement over hauling leachate by truck. Using the pump system, recirculation operations are not influenced by site or weather conditions.
- Using the operational techniques identified in the Project XL program for Maplewood, the anticipated benefits (i.e., settlement, improved leachate quality, and improved landfill gas quality) require more than 1.5 years to be realized.
- Based on the information obtained to date, it has been observed that leachate recirculation has been performed without major impacts (i.e., excessive odors, slope stability problems, etc.).
- The two trenches constructed in the second half of 2003 appear to be working well after approximately six months of operation. The operators have not noted problems related to drainage of these two trenches. Trenches 1, 2, and 3 continue to drain, but at a much slower rate than when first placed in operation.
- Because the trenches appear to have a reduced infiltration capacity when compared to their initial design, the ability to accept liquids is reduced. Consequently, a ten acre area may not be large enough to recirculate the target amount of leachate.
- In 2004, will consider different alternatives to improve liquid distribution in the recirculation area. WMI is considering a systematic pattern of vertical conduits to increase liquid distribution through the recirculation area. It is anticipated that the vertical conduits may be similar in nature to a landfill gas extraction well.

A summary of the monitoring events planned for 2004 is presented in Table 11.

TABLE 1
2003 MONITORING ACTIVITIES
Project XL
Maplewood Recycling and Waste Disposal Facility
Amelia County, Virginia

	Monitoring Parameters	Responsible Party	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
1. LEACHATE	Chemical parameters measured on site	WM personnel	X			X			X					
	Physical parameters measured on site	WM personnel	X	X	X	X	X	X	X	X	X	X	X	X
	Chemical parameters sampled on site from test area	Sampled by subcontractor, tested offsite by Geochemical	X			X			X					
	Chemical parameters sampled on site from storage tanks	Sampled by subcontractor, tested offsite by Geochemical	X			X			X					
2. LANDFILL GAS	Landfill gas composition measured on site	WM personnel	X	X	X	X	X	X	X	X	X	X	X	X
	Physical parameters measured on site	WM personnel	X	X	X	X	X	X	X	X	X	X	X	X
	Chemical parameters	WM personnel, testing by subcontractor	X			X			X					
	Surface landfill gas measured on site	Subcontractor	X			X			X					
3. SOLID WASTE	Survey, on site	Subcontractor	X		X		X		X		X		X	
	Solid waste stabilization and decomposition measured on site	WM personnel								X				

TABLE 2
SUMMARY OF SAMPLING ACTIVITIES
Project XL
Maplewood Recycling and Waste Disposal Facility
Amelia County, Virginia

Date	Sampling Event
8/2/2002	Topographical site survey
8/12/2002	Background leachate and landfill gas sampling
9/12/2002	Monthly landfill gas sampling
9/13/2002	Monthly leachate sampling
10/17/2002	Monthly landfill gas sampling
10/24/2002	Topographical site survey
10/28/2002	Monthly leachate sampling
11/20/2002	Monthly leachate sampling
11/21/2002	Monthly landfill gas sampling
12/18/2002	Monthly landfill gas sampling
12/26/2002	Monthly leachate sampling
1/23/2003	Monthly leachate sampling
1/28/2003	Monthly landfill gas sampling
2/15/2003	Monthly landfill gas sampling
3/10/2003	Topographical site survey
3/16/2003	Monthly landfill gas sampling
4/16/2003	Quarterly leachate sampling
5/21/2003	Monthly landfill gas sampling
6/9/2003	Topographical site survey
6/22/2003	Monthly landfill gas sampling
7/8/2003	Quarterly landfill gas sampling
7/16/2003	Quarterly leachate sampling
10/29/2003	Quarterly leachate sampling

TABLE 3
LEACHATE ANALYSIS PARAMETERS
Project XL
Maplewood Recycling and Waste Disposal Facility
Ameila County, Virginia

Parameter	Method	Parameter	Method
Cadmium	EPA 200.7	Bromochloromethane	EPA 8260B
Potassium	EPA 200.7	Bromomethane	EPA 8260B
Chloride	EPA 325.2	Carbon Disulfide	EPA 8260B
Ammonia Nitrogen	EPA 350.1	Carbon Tetrachloride	EPA 8260B
Total Kjeldahl Nitrogen	EPA 351.3	Chlorobenzene	EPA 8260B
Nitrate Nitrogen	EPA 353.2	Chlorodibromomethane	EPA 8260B
Phosphorus, ortho	EPA 365.2	Chloroethane	EPA 8260B
Phosphorus, total	EPA 365.2	Chloromethane	EPA 8260B
Sulfate	EPA 375.4	cis-1,2-Dichloroethene	EPA 8260B
Arsenic	EPA 6010 B	cis-1,3-Dichloropropene	EPA 8260B
Barium	EPA 6010 B	Dibromomethane	EPA 8260B
Chromium	EPA 6010 B	Dichlorobromomethane	EPA 8260B
Lead	EPA 6010 B	Dichlorodifluoromethane	EPA 8260B
Selenium	EPA 6010 B	Ethyl Methacrylate	EPA 8260B
Silver	EPA 6010 B	Ethylbenzene	EPA 8260B
Mercury	EPA 7470	Iodomethane	EPA 8260B
1,2-Dibromo-3-chloropropane	EPA 8011	Methacrylonitrile	EPA 8260B
1,2-Dibromoethane	EPA 8011	Methyl Ethyl Ketone	EPA 8260B
1,1,1,2-Tetrachloroethane	EPA 8260B	Methyl methacrylate	EPA 8260B
1,1,1-Trichloroethane	EPA 8260B	Methylene Chloride	EPA 8260B
1,1,2,2-Tetrachloroethane	EPA 8260B	Propionitrile	EPA 8260B
1,1,2-Trichloroethane	EPA 8260B	Styrene	EPA 8260B
1,1-Dichloroethane	EPA 8260B	Tetrachloroethene	EPA 8260B
1,1-Dichloroethene	EPA 8260B	Toluene	EPA 8260B
1,1-Dichloropropene	EPA 8260B	Total Xylene	EPA 8260B
1,2,3-Trichloropropane	EPA 8260B	trans-1,2-Dichloroethene	EPA 8260B
1,2-Dichlorobenzene	EPA 8260B	trans-1,3-Dichloropropene	EPA 8260B
1,2-Dichloroethane	EPA 8260B	trans-1,4-Dichloro-2-butene	EPA 8260B
1,2-Dichloropropane	EPA 8260B	Tribromomethane	EPA 8260B
1,3-Dichlorobenzene	EPA 8260B	Trichloroethene	EPA 8260B
1,3-Dichloropropane	EPA 8260B	Trichlorofluoromethane	EPA 8260B
1,4-Dichlorobenzene	EPA 8260B	Trichloromethane	EPA 8260B
2,2-Dichloropropane	EPA 8260B	Vinyl Acetate	EPA 8260B
2-chloro-1,3-butadiene	EPA 8260B	Vinyl Chloride	EPA 8260B
2-Hexanone	EPA 8260B	1,2,4,5-Tetrachlorobenzene	EPA 8270C
2-Methyl-1-propanol	EPA 8260B	1,2,4-Trichlorobenzene	EPA 8270C
3-Chloro-1-Propene	EPA 8260B	1,3-Dinitrobenzene	EPA 8270C
4-Methyl-2-Pentanone	EPA 8260B	1,4-Naphthoquinone	EPA 8270C
Acetone	EPA 8260B	1-Naphthylamine	EPA 8270C
Acetonitrile	EPA 8260B	1-Nitrosopiperidine	EPA 8270C
Acrolein	EPA 8260B	2,3,4,6-Tetrachlorophenol	EPA 8270C
Acrylonitrile	EPA 8260B	2,4,5-Trichlorophenol	EPA 8270C
Benzene	EPA 8260B	2,4,6-Trichlorophenol	EPA 8270C

TABLE 3
LEACHATE ANALYSIS PARAMETERS
(continued)

Parameter	Method	Parameter	Method
2,4-Dichlorophenol	EPA 8270C	Dibenzofuran	EPA 8270C
2,4-Dimethylphenol	EPA 8270C	Diethyl Phthalate	EPA 8270C
2,4-Dinitrophenol	EPA 8270C	Dimethoate	EPA 8270C
2,4-Dinitrotoluene	EPA 8270C	Dimethyl Phthalate	EPA 8270C
2,6-Dichlorophenol	EPA 8270C	Di-N-Butyl Phthalate	EPA 8270C
2,6-Dinitrotoluene	EPA 8270C	Di-N-Octylphthalate	EPA 8270C
2-Acetylaminofluorene	EPA 8270C	Di-n-propylnitrosamine	EPA 8270C
2-Chloro-Naphthalene	EPA 8270C	Diphenylamine	EPA 8270C
2-Chlorophenol	EPA 8270C	Disulfoton	EPA 8270C
2-Methyl-4,6-dinitrophenol	EPA 8270C	Ethyl Methanesulfonate	EPA 8270C
2-Methylnaphthalene	EPA 8270C	Famphur	EPA 8270C
2-Naphthylamine	EPA 8270C	Fluoranthene	EPA 8270C
2-Nitroaniline	EPA 8270C	Fluorene	EPA 8270C
2-Nitrophenol	EPA 8270C	Hexachlorobenzene	EPA 8270C
3,3-Dichlorobenzidine	EPA 8270C	Hexachlorobutadiene	EPA 8270C
3,3'-Dimethylbenzidine	EPA 8270C	Hexachlorocyclopentadiene	EPA 8270C
3-Methylcholanthrene	EPA 8270C	Hexachloroethane	EPA 8270C
3-Nitroaniline	EPA 8270C	Hexachloropropene	EPA 8270C
4-Aminobiphenyl	EPA 8270C	Indeno(1,2,3-cd)pyrene	EPA 8270C
4-Bromophenylphenylether	EPA 8270C	Isodrin	EPA 8270C
4-Chloro-3-methylphenol	EPA 8270C	Isophorone	EPA 8270C
4-Chloroaniline	EPA 8270C	Isosafrole	EPA 8270C
4-Chlorophenylphenylether	EPA 8270C	m,p-Cresol	EPA 8270C
4-Nitroaniline	EPA 8270C	Methapyrilene	EPA 8270C
4-Nitrophenol	EPA 8270C	Methyl Methanesulfonate	EPA 8270C
5-Nitro-o-toluidine	EPA 8270C	Methyl Parathion	EPA 8270C
7,12Dimethylbenz(a)-anthracene	EPA 8270C	Naphthalene	EPA 8270C
Acenaphthene	EPA 8270C	Nitrobenzene	EPA 8270C
Acenaphthylene	EPA 8270C	N-Nitrosodibutylamine	EPA 8270C
Acetophenone	EPA 8270C	N-Nitrosodiethylamine	EPA 8270C
Anthracene	EPA 8270C	n-Nitrosodimethylamine	EPA 8270C
Benzo(a)anthracene	EPA 8270C	n-Nitrosodiphenylamine	EPA 8270C
Benzo(a)pyrene	EPA 8270C	N-Nitrosomethylethylamine	EPA 8270C
Benzo(b)fluoranthene	EPA 8270C	N-Nitrosopyrrolidine	EPA 8270C
Benzo(ghi)perylene	EPA 8270C	o,o,o-Triethylphosphothioate	EPA 8270C
Benzo(k)fluoranthene	EPA 8270C	o-Cresol	EPA 8270C
Benzyl Alcohol	EPA 8270C	o-Toluidine	EPA 8270C
bis(2-Chloroethoxy)methane	EPA 8270C	Parathion	EPA 8270C
bis(2-Chloroethyl)ether	EPA 8270C	p-Dimethylaminoazobenzene	EPA 8270C
bis(2-Chloroisopropyl)ether	EPA 8270C	Pentachlorobenzene	EPA 8270C
bis(2-Ethylhexyl)phthalate	EPA 8270C	Pentachloronitrobenzene	EPA 8270C
Butyl benzylphthalate	EPA 8270C	Phenacetin	EPA 8270C
Chlorobenzilate	EPA 8270C	Phenanthrene	EPA 8270C
Chrysene	EPA 8270C	Phenol	EPA 8270C
Diallate	EPA 8270C	Phorate	EPA 8270C
Dibenzo(a,h)anthracene	EPA 8270C	p-Phenylenediamine	EPA 8270C

TABLE 3
LEACHATE ANALYSIS PARAMETERS
(continued)

Parameter	Method	Parameter	Method
Pronamide	EPA 8270C	Endrin Aldehyde	EPA 8081
Pyrene	EPA 8270C	Gamma BHC (Lindane)	EPA 8081
Safrole	EPA 8270C	Heptachlor	EPA 8081
sym-Trinitrobenzene	EPA 8270C	Heptachlor epoxide	EPA 8081
Thionazin	EPA 8270C	Methoxychlor	EPA 8081
Chemical Oxygen Demand	HACH 8000	Toxaphene	EPA 8081
Total dissolved solids	SM 2540C	2,4,5-T	EPA 8151A
Nitrite Nitrogen	SM 4500-NO2B	2,4-D	EPA 8151A
BOD 5-day	SM 5210B	Dinoseb	EPA 8151A
Total Organic Carbon	SM 5310C	Pentachlorophenol	EPA 8151A
Aldrin	EPA 8081	Silvex	EPA 8151A
Alpha BHC	EPA 8081	Pyruvic	
Beta BHC	EPA 8081	Lactic	
Chlordane	EPA 8081	Formic	
DDD	EPA 8081	Acetic	
DDE	EPA 8081	Proprionic	
DDT	EPA 8081	Butyric	
Delta BHC	EPA 8081		
Dieldrin	EPA 8081		
Endosulfan I	EPA 8081		
Endosulfan II	EPA 8081		
Endosulfan Sulfate	EPA 8081		
Endrin	EPA 8081		

Note

This list of parameters was developed from the Monitoring, Sampling, and Analysis Report included in the permit amendment submitted in October 2001.

Note:

This table is based on site records for the Maplewood Recycling and Waste Disposal Facility showing the amount of leachate collected in the primary and seconday leachate collection system. These records were provided by Waste Management and the site manager (Brian McClung) in a series faxes between September 2002 and December 2002.

The test area is represented by Ph 1&2 Nor and Ph 1&2 Sou, the control area is represented by Phase 3 and Phase 4, Phase 11 and Phase 12 are the current disposal areas and are provided for information purposes only.

TABLE 9
RAINFALL DATA SUMMARY
Project XL
Maplewood Recycling and Waste Disposal Facility
Amelia County, Virginia

Month	Average Precipication	2003 Precipitation	Departure from Normal
January	3.24	2.18	-1.06
February	3.16	4.21	1.05
March	3.61	5.92	2.31
April	2.96	4.38	1.42
May	3.84	8.59	4.75
June	3.62	3.87	0.25
July	5.03	9.26	4.23
August	4.4	4.66	0.26
September	3.34	10.12	6.78
October	3.53	2.43	-1.1
November	3.17	3.39	0.22
December	3.26	4.26	1
Total	43.16	63.27	20.11

Note: The totals for 2003 precipication and departure from normal are for the year to date.
Rainfall data is for Richmond, Virginia.

Notes:
This table summarizes the leachate parameters that were detected in the Leachate Tank. Samples where the concentration may be greater than the MCL are show in in **bold**.
In some cases, the method detection limit is higher than the MCL.
